Get common email fields (Subject, Text) with IMAP

In this article we'll show how to download emails using Mail.dll IMAP client and **access some common email properties** like: Subject, Date, Html, Text and Attachments.

Remember about adding a reference to Mail.dll and importing namespaces.

First you need to download email from IMAP server using *Imap* class. Then parse it using *MailBuilder* class. After that you'll receive *IMail* interface.

This interface can be used to access all standard and non-standard headers.
Subject, From, To, Date, email data like: Text and Html versions of the email, and others can be accessed as simple properties. This sample also shows how to access Attachments collection.

```
// C#

using System;
using System.Collections.Generic;
using Limilabs.Client.IMAP;
using Limilabs.Mail;
using Limilabs.Mail.MIME;
using Limilabs.Mail.Headers;

class Program
{
    static void Main(string[] args)
    {
        using(Imap imap = new Imap())
        {
            imap.Connect("imap.example.com");    // use ConnectSSL fo
            imap.UseBestLogin("user", "password");

            imap.SelectInbox();
            List<long> uids = imap.Search(Flag.Unseen);

            foreach (long uid in uids)
            {
                var eml = imap.GetMessageByUID(uid);
                IMail email = new MailBuilder()
                    .CreateFromEml(eml);

                // Subject
                Console.WriteLine(email.Subject);

                // From
                foreach (MailBox m in email.From)
                {
                    Console.WriteLine(m.Address);
                    Console.WriteLine(m.Name);
                }

                // Date
                Console.WriteLine(email.Date);

                // Text body of the message
                Console.WriteLine(email.Text);

                // Html body of the message
                Console.WriteLine(email.Html);

                // Custom header
                Console.WriteLine(email.Document.Root.Headers["x-spam

                // Save all attachments to disk
                foreach (MimeData mime in email.Attachments)
                {
                    mime.Save(@"c:\" + mime.SafeFileName);
                }
            }
            imap.Close();
        }
    }
};
```

```
' VB.NET

Imports Limilabs.Client.IMAP
Imports Limilabs.Mail
Imports Limilabs.Mail.MIME
Imports Limilabs.Mail.Headers
Imports System
Imports System.Collections.Generic

Public Module Module1
    Public Sub Main(ByVal args As String())

        Using imap As New Imap()
            imap.Connect("pop3.example.com")    ' use ConnectSSL for
            imap.UseBestLogin("user", "password")

            imap.SelectInbox()
            Dim uids As List(Of Long) = imap.Search(Flag.Unseen)

            For Each uid As Long In uids
                Dim eml = imap.GetMessageByUID(uid)
                Dim email As IMail = New MailBuilder() _
                    .CreateFromEml(eml)

                ' Subject
                Console.WriteLine(email.Subject)

                ' From
                For Each m As MailBox In email.From
                    Console.WriteLine(m.Address)
                    Console.WriteLine(m.Name)
                Next

                ' Date
                Console.WriteLine(email.[Date])

                ' Save all attachments to disk
                For Each mime As MimeData In email.Attachments
                    mime.Save("c:\" + mime.SafeFileName)
                Next
            Next
            imap.Close()
        End Using

    End Sub
End Module
```

To, Cc and Bcc headers are a bit tricky as they can contain address groups. You can learn more about how to work with them in how to access To, Cc, Bcc fields article.
